

PHASE 2 – REQUIREMENT ANALYSIS

Project: Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Purpose

This phase identifies the functional and process requirements required to implement the automated Standard Laptop procurement workflow.

Functional Requirements

- Provide a Standard Laptop item through Service Catalog.
- Allow a user to place a Standard Laptop request.
- Process the request through approval.
- Use the Service Catalog process as the workflow trigger.
- Create a Catalog Task automatically after approval.
- Use the Requested Item record when creating the Catalog Task.
- Set the task description to indicate that the laptop needs configuration.
- Assign the Catalog Task to the Hardware group.
- Use Approved as the approval value/condition.
- Allow the created task to be verified under Catalog Tasks.

Process Requirements

The process should reduce manual intervention, reduce delays in laptop configuration, improve task allocation, support timely fulfillment, reduce user waiting time, and improve IT procurement efficiency.

Platform and Components

ServiceNow is the implementation platform. Flow Designer provides the automation. Service Catalog provides the Standard Laptop request. The Requested Item record supplies request context, and the Catalog Task represents the configuration work assigned to Hardware.

Input - Process - Output

Input: Standard Laptop request. Process: approval followed by Flow Designer automation.

Output: a Catalog Task assigned to the Hardware group for laptop configuration.

Acceptance Criteria

The Standard Laptop item must be orderable, the request must support approval, the configured flow must execute at the intended stage, a Catalog Task must be created, the configuration description must be present, and the Assignment Group must be Hardware.

Conclusion

These requirements form the foundation for the design and development of the automation.
